

Exercise session 3 and 4: derivative free optimization, metaheuristics

Question 1.

1. What happens in simulated annealing when the cost function J is replaced by the cost function $4J$, respectively $J + 3$? Answer the same question in the case of an evolution strategy.
2. Compare an evolution strategy ES(1+1) and a simulated annealing.

Question 2.

The stochastic ranking algorithm, described below, allows to rank λ individuals in a constrained optimization problem solved with an evolution strategy.

```
1   $I_j = j \forall j \in \{1, \dots, \lambda\}$ 
2  for  $i = 1$  to  $\lambda$  do
3      for  $j = 1$  to  $\lambda - 1$  do
4          sample  $u \in U(0, 1)$  (uniform random number generator)
5          if  $(\phi(\mathbf{x}_{I_j}) = \phi(\mathbf{x}_{I_{j+1}}) = 0)$  or  $(u < P_f)$  then
6              if  $f(\mathbf{x}_{I_j}) > f(\mathbf{x}_{I_{j+1}})$  then
7                   $swap(I_j, I_{j+1})$ 
8              fi
9          else
10             if  $\phi(\mathbf{x}_{I_j}) > \phi(\mathbf{x}_{I_{j+1}})$  then
11                  $swap(I_j, I_{j+1})$ 
12             fi
13         fi
14     od
15 if no  $swap$  done break fi
od
```

Fig. 2. Stochastic ranking procedure, $P_f = 0.45$.

Here, f is the cost function to minimize, Φ the penalty function and P_f is a parameter.

1. What happens when $P_f = 0$, respectively 1?
2. Write a Python script that uses the stochastic ranking for λ individus, a function f and a given penalty Φ .
